

## ABSTRACT

A server for enabling a first terminal to switch between a mobile communication network and a packet network, with the first terminal continuing a communication with a second terminal. The server comprises a session managing unit storing a first address of the first terminal assigned to a first session and a second address of the second terminal assigned to a second session, a receiving unit receiving a packet containing user data from the second terminal, a switching unit switching from the first session of a packet having the first address as a destination and containing the user data to the second session of a packet having the second address as the destination and containing the user data on the basis of the addresses in the session managing unit, and a transmitting unit transmitting the packet using the second session switched by the switching unit.
